

“If enterprises cannot allocate appropriate resources for packaging and extensive testing, outsourcing should be considered.”

Gartner 2003

What is Application Packaging?

When you purchase a software application to install it onto a computer you will need to execute something like setup.exe. Setup.exe is an installation routine, a program that puts all of the files and registry keys in the right places so that everything works correctly. This is in essence a package. However the setup routine can sometimes be very complex and open to user error especially when thousands of repeat installations are required in a corporate environment. In such environments reliability and repeatability are crucial where compliance to SOX or 21CFR part11 may be required. This is where application repackaging comes into its own. An experienced application packager can take a vendor application and re-write the setup routine to the specific requirements of the client. Ensuring both a reliable and accurate installation every time. The package can then be deployed silently, if desired, via your chosen deployment mechanism to all of your target workstations or users. It's a very rapid and accurate way to do large scale deployments

How do we achieve it?

Here at Packaging Team we have a wealth of experience in Application Packaging. Our staff have designed application packaging strategies from the ground up for the Financial, Pharmaceutical and Manufacturing industries. We have the tools and the systems ability to produce packages to meet your requirements in a timely manner.
